Postlab Exercise

Write a servlet that enables the user to change the password from an HTML form, as shown in the Figure 1 below. Suppose that the user information is stored in a table named Account with three columns, username, password and name, where name is the real name of the user. The servlet performs the following task:

a. Verify that the username and old password are in the table. If not, report the error and redisplay the HTML form.

b. Verify that the new password and the confirmed password are the same. If not, report the error and redisplay the HTML form.

c. If the user information is entered correctly, update the password and report the status of the update to the user, as shown in Figure 2.
